The **KP- 33DIG** is a monochrome high resolution progressive scan camera featuring a LVDS output that includes 10 bit digital video, RS-232C remote control and trigger control lines. Designed for machine vision and image processing systems, the camera is capable of producing 15 frames at full vertical resolution, or 60 frames per second in the 4 times accelerated mode of operation of progressively scanned video, from the 1.45 million pixel CCD array. Square pixels make for an easy interface with vision and measurement systems. A frame on demand function allows images captured by use of an external trigger to be output immediately. An analog and a LVDS output are provided. The LVDS output allows direct interface with image processing systems, eliminating the A/D converter in the image processor. A multi step electronic shutter along with external H and V drive inputs, provide for ease of use in systems applications. The **KP-33DIG** also features an RS-232C remote control port for control of all camera functions.
